The ring sizers below indicate both whole and half sizes. Whole sizes are marked by bubbled numbers and the half sizes are the less prominent grey lines.

When printing this PDF do not allow your computer to rescale the image size in any way.
Measure the line below to make sure it is $4-3 / 8^{\prime \prime}$. Ensuring the size accuracy of your printout will allow you to properly measure your ring size.

Once printed, this line segment should measure 4-3/8"

Cut out a printable ring sizer from above and use it to determine the size ring that fits best. Cut along the dashed line next to the arrow by folding the rounded end in half (with wrong sides together) and make your cut as straight as possible along the dashed line. When you wrap the ring sizer around your finger, the smaller pointed end of the sizer will slide through the back of the cut slot you made to reveal your ring size, which the arrow will be pointing. If the arrow is touching a numbered bubble that number is your ring size. If the arrow is touching an un-number grey line, then your ring size is a half size such as: $61 / 2$ which falls between the 6 bubble and the 7 bubble.

When measuring the finger you intend to wear your ring on, you'll want to measure your knuckle and the base of your finger. Whichever has the larger measurement will be your ring size. This is to accommodate for
your ring to slide over your knuckle, if your knuckle is the larger measurement.

Following these instructions will give you a more loose fit. If you want a more snug fit, your preference will be one size down from what you measured.
( *I personally go the one size down for the more snug fit.* )
